# Hydrographic Journal of Jean-Marie Maurouard 

 (notebook 9 iii)

# Hydrographic Journal of Jean-Marie Maurouard Archives nationales de France, série Marine, 5JJ56 

## Period covered

13 Messidor Year IX [2 July 1801] - 22 Ventose Year X [13 March 1802]

## Notes on the texxt

Maurouard left two notebooks, annotated $\mathrm{N}^{\circ}$. 9 bis and 9 ter. These journals cover only part of the voyage. The notebook numbered 9 bis is the narrative of the events that took place between 3 November 1802 and 27 January 1803. In the notebook numbered 9 ter, translated here, Maurouard notes the observations and measurements taken in New Holland between 2 July 1801 and 13 March 1802.

The page numbers in square brackets are those of the original French manuscript.

## Translation

# [Title page] <br> Hydrography <br> [signed] Maurouard Midshipman 1st Class <br> GG. 

[Second title page]
Journal containing all the work relative to the maps
Time is counted astronomically, and all the bearings are as given by the compass, that is to say not corrected for variation.

## Shark Bay.

13 Messidor [Year 9-2 July 1801] at [blank] From the anchorage, we took the bearings of the northern tip of an island shown on a Dutch hand-drawn chart

Distance of the sun at this point. N. 720
The sun being on the left.

$$
=\frac{\frac{-606 .^{\circ} 50^{\prime}}{113 .^{\circ} 10^{\prime}}=}{37 .^{\circ} 37 .^{\prime} 0^{\prime \prime}}
$$

At 19 h 54 ' by the chronometer, the bearing of the same point had been taken and one had for the distance from the sun to the object the angle to the left
$720^{\circ}$
$\frac{-648.35 .^{\prime} 30^{\prime \prime}}{71.24 .30}$
Height of the sun
28. 7.30

At the same time a white land close by, and on the same crest.
Dist. from the sun

Height of the sun
The furthest extremity of the island scarcely visible and uncertain.

Height of the sun
29. ${ }^{\circ} 18 .{ }^{\prime}$
14. [messidor] At zero hour. Obs. Lat.

Long. ${ }^{\text {de }}$ taken at midday Chronometer $\mathrm{N} .{ }^{\circ} 38$.
25.30. 39
109. 18. 15

16 Messidor [Year 9-5 July 1801] Tbe observatory was established on the northern island of the Sterile group and, as a result of the observations, the following latitudes and longitudes were obtained.

Lat. 24. ${ }^{\circ} 47 . .^{\prime} 30$ " $\}$ in the tents.
Long. 109. 2. 9. \}
The latitude of the southern tip of the most southerly of the Sterile islands was found to be $25 .{ }^{\circ} 17$ ' by C. ${ }^{\text {n }}$ Freycinet.
And this island, according to him, runs north/south Lat. $\left.24 . .^{\circ} 45 . .^{\prime} 30 . .^{\prime}\right\}$ northern tip of the island The variation found was $5 .^{\circ} 16^{\prime} 8^{\prime \prime} \mathrm{N} . \mathrm{O}$
108. 59. 18. \}

The northern tip of Dirk Hartog Island remained at S. 30. 50'.W A reef extending from $\mathrm{S} 2^{\circ}$

25 Messidor [Year 9 - $\mathbf{1 4}$ July 1801] at zero hour. Lat. observed 24. 21. 45 Long. 109. 9.
33. Compass bearings taken of the high ground at the entrance to Shark Bay E. $17^{\circ} \mathrm{N}$

A cape following immediately at $\mathrm{E} 40^{\circ} 30^{\prime} \mathrm{N}$. a last tip visible at E .46 . N
Meridian height $43 .{ }^{\circ} 43 .{ }^{\prime} 30^{\prime \prime}$
Azimuth at the entrance to the bay a moment after midday Dist. ${ }^{\text {ce }}$ sun to land $720^{\circ}$ $\frac{-642499^{\circ} 30^{\prime \prime}}{77.10 .30}$
height of the sun 43.38.
At 1 h .15 hours the same point, or entrance to the bayDist from the sun $720^{\circ}$
$\frac{-61543^{\prime} 30^{\prime \prime}}{104.16 .30}$
Height of the sun 3929.

At 1h.20. the last cape or tip in view

$$
\text { Compass bearing } \quad \text { E. } 1 .^{\circ} 30^{\prime} \mathrm{N} \text {. }
$$

D. ${ }^{\text {te }}$ from the sun 720
-642.47.30
77. 12. 30
height of the sun
39.11."

Compass bearing E. $39 .^{\circ} 30^{\prime} \mathrm{N}$.
From midday to 1 o'clock $2^{\mathrm{N}, 7}$ [ ?], to the North. $5^{\circ}$ is $15^{\circ}$ drift, [ ?] winds from W.N.W. $\mathbf{2 4}$ [Messidor - $\mathbf{1 3}$ July 1801] at 23. ${ }^{\mathrm{h}}$ I took the bearing of the cape which is at the entrance to the bay at E. $17 . .^{\circ}$ N. The same cape on a hand-drawn Dutch chart is placed at $24 .{ }^{\circ} 4$ south latitude.

## [2]

Citizen Bernier, astronomer, realized that the correction for the chronometers was too great and, following a new correction, he places the northernmost tip of the Sterile islands at $110 .^{\circ} 10^{\prime}$ and the entrance to the bay whose bearings are opposite at $110 . .^{\circ} 54 . '$

2 Thermidor Year 9 [21 July 1801] in sight the N.W. tip
of New Holland.
Distance from the sun to the N.W. tip, sun on the left
$536 .^{\circ} 29^{\prime} 30{ }^{\prime \prime}$
-464.18 .
height of the sun $\quad 35 .^{\circ} 12$
This tip lies at S. $69 .{ }^{\circ} 31$. 30.' E. in agreement with the compass

Distance from the sun to a second headlands forming the northern headland of the supposed William River.

|  | $720^{\circ}$ |
| :---: | :---: |
|  | -561.44 |
|  | $158 .^{\circ} 16$ The compass bearing seems preferable |
| height of the sun | $35.37{ }^{\prime}$ |

Angle included between the two headlands of the supposed river $9 .{ }^{\circ}$
from the second tip to the end of the land in view $41 .^{\circ} 25$. . With the sextant. $^{\circ}$
Compass bearings of the same points
La $1 .{ }^{\text {st }}$ headland E. $22 .^{\circ} \mathrm{S}$.
La 2. ${ }^{\text {nd }}$ id. E. $59 .^{\circ} 30^{\prime} \mathrm{S}$
La 3. ${ }^{\text {rd }}$ id. E. $70 .{ }^{\circ} 0 \mathrm{~S}$
La 4. ${ }^{\text {th }}$ id. E. 79. $0^{\prime}$ S.
At $23 .^{\text {h }} 30^{\prime} \quad$ Dist. From the sun to the N.W. headland $586 .^{\circ} 29^{\prime} 30^{\prime}$ sun on the left

From this cape to the $\left.2 .^{\text {nd }} \quad 26 .^{\circ} 46 \quad\right\}$
to the $\left.3^{\text {rd }} 32.41 \quad\right\} \quad$ with the sextant
to the $\left.4^{\text {th }} \quad 45.56 .30 \quad\right\}$
Bearings of the same points with the compass and at the same time.

| N.O headland | E. $57 .{ }^{\circ} 30^{\prime} \mathrm{S}$. |
| :--- | :--- |
| 2..$^{\text {d }}$ headland | S. $2.30^{\prime} \mathrm{E}$. |
| 3. ${ }^{\text {rd }}$ headland | S. $1.0 . \mathrm{W}$ |
| $4 .{ }^{\text {th }}$ headland | W. $72 .^{\circ}$ S. |

The land is high towards the headlands of the supposed River William and low in every direction apart from these headlands.
$1 .{ }^{\circ} 44^{\prime}$ must be added to chronometer $\mathrm{N} .{ }^{\circ} 27$ in order to calculate the position of the N.W. headland \&c. \&c.

## 21 Thermidor [Year 9-9 August 1801]

$\begin{array}{ll}\text { At 20. }{ }^{\mathrm{h}} \text { azimuth } \quad \text { Dist. from the sun to small island A } & 720^{\circ} \\ & \frac{-678.50^{\prime}}{41.0^{\circ} 10^{\prime}} \\ & 28.41 .\end{array}$

[12 bis - folded pale blue sheet glued to page 12]
Supplement to the bearings taken from the anchorage at the roadhead of Coupang and from $\mathrm{N} .{ }^{\text {os }} 22$, 24 . et 25.

Not having been able to determine the parts of the coasts of Timor and Simao which form the Bay of Coupang with the bearings taken from the anchorage at from $\mathrm{N}^{\mathrm{os}} 2224$ and 15, we had to move towards the entrance to the channel until we were at the point on the coast where the supporting line of sight of the ship was tangential to this coast ; then from this point, several of those previously determined in the channel will serve to determine the contour of the Bay of Coupang.
$1^{\text {st }}$ position the point on the coast being that where the line of sight going from the ship was tangential to this coast and within sight of S or M .

Cap. F. H. This headland was low and finished in a sandy bay.

# Expedition in the long boat along Van Diemen's land. During Ventose Year 10. 

[Title over two pages - pages 16 and 17]
[on the left: table in several columns in which are noted the times, winds, courses, speed in knots, drift, soundings and distances to land. On the right, a column contains the remarks of Maurouard.]

## Remarks

14 Ventose Year 10 [ 5 March 1802] at 22h.50. I sheered off in the longboat and ran to the west by compass with a speed of $41 / 2$ knots until midday.

15 [Ventose Year 10-6 March 1802] the midday observation of the sun's altitude was $53 .{ }^{\circ}$ 35.' 15."

The Géographe bearing $\mathrm{N} .81^{\circ} \mathrm{E}$. and (A) or Cape Pele bearing S. $52^{\circ} \mathrm{W}$ there are five rocks which extend from the land up to 150 toises ${ }^{1}$ off shore. Having been impeded by currents which set to the south, we left at $1 \mathrm{~h} .40,300$ toises $^{2}$ to the east of the rocks, which we were opposite at 0.30 h .
Navigating from Cape Pélé as far as the entrance to the sandy cove. Arid terrain with many large rocks extending down to the water's edge.
Opposite the southern tip of a sandy cove, the Géographe bearing N. $30^{\circ}$ E. Having wanted to rejoin the Géographe, we found ourselves at the same spot until 4.00 h ., having been held back by the wind and currents. The Géographe out of sight of the anchorage $2 / 3$ of the way along a sandy cove.
At 18.00 h we started work; it was quiet. Opposite the headland N of the sandy cove, the headland S bearing $\mathrm{S} \cdot 10^{\circ} \mathrm{E}$. Headland N and headland B which immediately follow one another to the north.
At 20 h 15 (B) and headland D very far distant bearing $\mathrm{N} .15^{\circ} \mathrm{W}$, B and C bearing $\mathrm{N} .30^{\circ} \mathrm{W}$ at $21 \mathrm{~h} 45^{\prime}$ being so close to $B$.

16 Ventose [Year 10-7 March 1802] Midday observation of height of sun $53^{\circ} 27^{\prime}$.
[0.30h.] C 200 toises $^{3}$ away in the direction of the course; there are several large rocks in front of C which are exposed and extend approximately 100 toises $^{4}$ out to sea. The course is ruined by the effect of currents; at 2 h 40 we were at the same spot as at 0 h 30 . C one mile away at right angles to the course from 300 h to 500 h , opposite another large cove.
The land close to the shoreline has a gentler slope than that we have sailed along until now. The mountains are high but at a greater distance.
At the anchorage, the distance to shore must be taken at right angles to the course from the start, which begins at 17.30. Abeam a spit of land, a reef running from S.W. to N.W. which stretches 200 toises $^{5}$ offshore. Small sandy cove behind the reef and (a) small rocky headland. Sandy cove. Opposite D is the beginning of a large sandy cove, the ground is low and well wooded.

[^0]
## [17]

## 17 Ventose [Year 10 - 8 March 1802]

We headed to a small island where we landed at 24h10. The midday observation of the height of the sun was not observed from the island because its vertical passed over the small island. But on 8 Germinal, being on board the Naturaliste, the latitude observed at midday was $41^{\circ} 44^{\prime} 41^{\prime \prime}$. At 3 o'clock I observed the small island to the west of our position and, the passage made to the north from midday, would put this small island at a latitude of $41^{\circ} 21^{\prime} 50^{\prime \prime}$. At 18 h 45 ' we started work.
End of the sandy cove and abeam of the rocks which are at the end of the reef which, stretching from the current position of the longboat, extends up to 3 miles offshore. From 19 h 45 ' to 20 h 10 ' in narrows between the land and the rocks. Taking soundings continually and finding from four to eight fathoms [of water with a] sandy and rocky bottom.
At 20h10' E and F bearing N. $50^{\circ} \mathrm{W}$ : between these two points there is a cove that we did not inspect. Close to shore: from 21 h 50 to 22 h 15 no headway was made. From 23 h 45 'until midday [sic = midnight?] no headway.

## Expedition in the long boat along the east coast of Van Diemen's land.

18 Ventose [Year 10, 9 March 1802] at midday the observation of the height of the sun was $53^{\circ} 25^{\prime}$.
From 2 o'clock to 2.30, no headway.
At 3h45, 600 toises $^{6}$ from land.
At 4 h15 abeam the rocks which are on land and extend up to 300 toises $^{7}$ offshore. A sandy bay starts there about 3 miles in length in front of which are rocks separate from one another.
At 4 h .45 ' we were abeam the other end of the bay and $1 / 2$ mile from land. We anchored at the entrance to another bay whose entrance is like the preceding one, closed off by separate rocks which allow only small boats to enter.
At 5 h 30 , we sighted a sail in the east. We got under way and arrived on board at 7 h 30 in the evening.
[No intervening entries]
21 Ventose Year 10 [12 March 1802] Bearings made from this anchorage
Anchorage of 18 . South $45^{0}$ E. 5 miles distant. [G]
(H) E. $58 .{ }^{\circ}$ S 2 miles distant. The end of the rocks forward of (H) E. $22 .^{\circ}$ south, and two miles distance from land.
(I) at $\mathrm{N} 22 .^{\circ} 30^{\prime} \mathrm{W}$. From this headland stretch the rocks which run from east to west, and the bearing of whose extremity, taken from our anchorage, remains at $\mathrm{N} .45^{\circ} \mathrm{E}$. The cove HI is not accessible by large boats.
[19h 30] One mile from land in the direction of the course. No headway from 19h30 to 20h00. [20h 30] 500 toises $^{8}$ away from an on-shore rock, in front of which the sea breaks.
From 20 h 30 to 23 h 00 , no headway.
[24h] Land at three miles to the west.
22 Ventose [Year 10-13 March 1802] Midday height of the sun $52 .^{\circ} 6 . .^{\prime}$
[ $0^{\mathrm{h}} 45$ ] A reef 3 miles seaward of our course stretching from the North to $\mathrm{N} 22^{\circ} \mathrm{E}$.
[ $1^{\mathrm{h}} 30$ ] Rocks bearing north at $0 .{ }^{[=[\mathrm{h}]} 45$ ' remained $\mathrm{N} 22 .{ }^{\circ}$ E. at 1 h 10
At 1.h 30 the reef at $\mathrm{N} 66 .{ }^{\circ}$ E. a mile and a half away at right angles to the course of the longboat and off shore.
[ $2^{\mathrm{h}} 35$ ] Swan Island two miles away bearing N. $22^{\circ} \mathrm{W}$; we brailed up our sails and steered towards the island, near which we anchored at 3 h 30 .
Observed latitude of Swan Island is $40 . .^{\circ} 41 . .^{\prime} 30 . '$ in the northern part

The observations are by M. St. Cricq.

[^1]This notebook contains almost all the work carried out from the arrival of the Géographe in New Holland until the moment I left it, that is to say on 14 Ventose Year 10 [15 March 1802] when I was sent in a boat to survey the geography of the east part of Van Diemen's Land lying between the Schouten Peninsula and Banks Strait. Work that I did in four days, and with 24 hours' rations, from the time I left the ship.

On 10 Thermidor, Year 10 [29 July 1802] I gave Commander Baudin the chart drawn up of this part of the coast, with the data used, and an added report. I believe that this chart was not sent to the government with the others, or at least the person in charge of packing up the charts did not find it.

The results of the small amount of work done on the N.W. coast of New Holland are not put down in this notebook, however I have done all the calculations for it jointly with Citizen Boullanger, geographer on board the Géographe, and the results were given to the commander.

During all the time that we were in sight of land, the geographer [from the] Géographe continually asked the commander to have the ship's course written in the log, as they had been followed by the ship. The commander, being too ignorant of geography to realise the correctness of the geographer's request, did not want to agree to it, and always had the partial tracks reduced to a single course for each watch. It is true to say that the commander is having made a duplicate of the log book that he proposes to give to the government, and in which things are recorded only in the manner which he sees fit, both for the variations in the course and for the historical narrative, and that he hopes to remove the log signed by the officers on the pretext that it is too dirty to be presented to the government. (At least that is what he said.)

Nota bene I kept a private log book as long as we were in sight of land and doing the geographical survey; the geographer from the Géographe has it in his keeping, and I do not know if it reached the government or if the geographer from the Géographe kept it in order to turn it to good account if possible in the new voyage that the Géographe is undertaking on the N.W. coast.
